

Antifa Command & Control Structure in field action.

Structure, insignia and other identifiers.

Antifa tactical units are organized into standard 'company structure' of up to 20 individual soldiers under the immediate control of a company commander. While there are 'special units', most notably the 'reconnaissance & coordination' teams of bicyclists, the base of the C&C structure for Antifa is the company.

Company commanders are 'first lieutenants' and may be identified in the field by their actions within the group, and frequently by possession of DX SDR units of some form. These 'duplex (send/receive) software defined radio' units will be small, and most probably attached to a smart phone. It is through the SDR's that the encrypted commands are passed to operational units. On arrest, 1st Lieutenants have been observed discarding their identifying equipment as well as destroying their phones.

First Lieutenants can also be identified as being the local hub for bicycle traffic. In observations of rioting/looting activity, particularly with long distance videos of quality, bicyclists can clearly be seen reporting to 1st Lieutenants & even seeking them out in the mob. For this activity, bicyclists have been noted to employ 'proximate apps' to locate their units & commanders.

The Antifa field organization has up to 4 companies reporting to a 'captain (coordinator)'. Antifa Captains may be identified by common actions & equipment. Captains are 'free floating' within the mob movement, but will always be associated with increased bicycle traffic as well as 'emblems' of authority/command. These emblems include specific types & shapes of video camera gear. Antifa soldiers are trained to center on the emblems of both 1st Lieutenant as well as Captains. Some of the Captains have been observed pulling their command together by holding up the long lens video camera overhead while running a pattern of flashes from the light bars. These are swept around the mob & new organization results.

Captains control and coordinate their company commanders by use of the SDR devices & will be observed in the field speaking into throat microphones while receiving by ear plugs or in-built headphones in their helmets. So far, all identified captains have been observed to be wearing some form of short coverage helmets. These appear to be adapted from the forms used by rock climbers. Captains will also be identified by the apps loaded on their phones, the SDR units,

In field actions, captains can be most frequently spotted by their movements coordinating 1st lieutenants. Their most often observed task is enforcing discipline during the riots. In video footage of the day time looting in CA, the captains can be observed running up to enforce movement of specific companies that had been bogged down in looting, rather than attending to the mission being directed by the captain. In such incidents the first action of the captain is to force the soldiers attention on the video camera being waved around. Once recognition of rank is obtained, the captains can be seen pushing & forcing Antifa soldiers to specific actions, including pointing out their 1st Lieutenants. Captains have also been observed directing companies to attack specific locations they were identifying from maps on

their phones. Looting has been preplanned for specific strategic and tactical goals as has been observed with the complex Antifa C&C actions at the looting of the Melrose high end Art store in CA.

In the field, Antifa C&C structure can be observed to include a 'Colonel' rank. These Colonel Antifa commanders are identified by being always accompanied by a 'squad' of up to half company strength used to control & protect the Colonel within the mob movements. Colonels have been identified as their supporting soldiers created paths for them through active riot areas. Other identifiers include near constant attendance by bicyclists, many of whom have 'rolling command centers' of digital & other equipment on racks on the bikes. As with Captains, the Colonels will also most frequently be seen wearing helmets, many with antenna off the back. These are part of the encrypted SDR systems that have been found to be hotspots of radio activity during riots. Antifa relies heavily on digital equipment, but other than minor levels of encryption, appears to be unsophisticated in wider applications, nor do they appear to be aware of their vulnerability to location by EMF triangulation.

The Antifa command and control structure, as so far observed, does not expose any levels higher than Colonel to visibility. All the 'General' level field officers have so far only been observed in vehicles being used as coordination centers. These have been noted to be extensively modified with electronic support systems.

The structure of Antifa in the field most closely resembles the 'color' revolutions created by the CIA. The tactics employed so far in these Antifa field actions have very simiular targets & tactics as was observed as far back in time as the Viet Nam conflict, and in other arenas in which the CIA created wars and destabilized regimes.

While this is the end of this report on the Antifa C&C structure, it is worth noting that, in the observations taken from video footage, there is a suggestion of an 'Unknown Actor' (UA) within the activites involved in the looting. This UA is, like Antifa, organized, and can have many operatives within the mob at any given point. This UA does not appear to be engaging in escalation, rather appears to be most focused on 'tagging' the Antifa, with the presumed goal of identifying active members. These 'tagging' incidents have been observed employing very sophisticated UV light reflective paint 'dots' and 'lines' being placed on individual Antifa by UA agents using what appears to be a 'nylon tipped marker'. Several of these markers with no product identifying marks have been recovered in debris following looting episodes. Also in one instance, a small bag of magnetic field reflective 'dots' of self-adhesive vinyl was also recovered. It is assumed that UA is using these as trace & track methods for their own purposes. The UA agents are exceptionally well trained and disciplined, exhibiting awareness of video activity sufficient to allow these agents to not yet be identified.

Further descriptions will be provided as the analysis of the ongoing actions continue. Check back periodically or follow on twitter & GAB for notices of new postings.
